## PI

## 1 - FORMULAS

If you are serious about doing A level Chemistry, you MUST be able to write a formula without a second thought. It is the single most essential skill for an A level chemist.

You have to know and be able to use the information on this page - you should not be looking it up. There is no data sheet with ion charges at A level.

If you can't write a formula in an instant, DROP CHEMISTRY NOW and choose something else.

## Elements

| Monatomic | Simple molecular | Ionic | Metallic | Giant covalent |
| :---: | :---: | :---: | :---: | :---: |
| helium <br> neon <br> argon <br> krypton xenon <br> radon | hydrogen <br> nitrogen <br> oxygen <br> fluorine <br> chlorine <br> bromine <br> iodine <br> phosphorus <br> sulfur | There are no ionic elements!! | The formula is just the symbol, e.g. <br> magnesium <br> iron <br> sodium <br> nickel | The formula is just the symbol <br> diamond <br> graphite <br> silicon |

## Compounds

| Monatomic | Simple molecular | Ionic | Metallic | Giant covalent |
| :---: | :---: | :---: | :---: | :---: |
| There are no monatomic compounds!! | Some common molecular compounds: <br> carbon dioxide <br> carbon monoxide <br> nitrogen monoxide <br> nitrogen dioxide <br> sulfur dioxide <br> sulfur trioxide <br> ammonia <br> methane <br> hydrogen sulfide | These have to be worked out using ion charges - you have to know these at AS/A level! <br> LEARN them ASAP. <br> Note these acids: <br> hydrochloric acid <br> sulfuric acid <br> nitric acid <br> phosphoric acid | There are no metallic compounds!! | silicon dioxide |

| Positive ions |  | Negative ions |  |
| :---: | :---: | :---: | :---: |
| Group 1 ions: <br> lithium <br> sodium <br> potassium <br> Group 2 ions: <br> magnesium <br> calcium <br> barium | Group 3 ions: <br> aluminium <br> Other common ions <br> silver <br> zinc <br> ammonium <br> hydrogen | Group 7 ions: <br> fluoride <br> chloride <br> bromide <br> iodide <br> Group 6 ions: <br> oxide <br> sulfide | Other common ions <br> nitrate <br> sulfate <br> carbonate <br> hydrogencarbonate <br> hydroxide <br> hydride <br> phosphate |

## TASK 1 - WRITING FORMULAS OF IONIC COMPOUNDS

1) silver bromide
2) sodium carbonate
3) potassium oxide
4) iron (III) oxide
5) chromium (III) chloride $\qquad$
6) calcium hydroxide
7) aluminium nitrate
8) sodium sulfate
9) lead (II) oxide
10) sodium phosphate
11) zinc hydrogencarbonate
12) ammonium sulphate
13) gallium hydroxide
14) strontium selenide
15) radium sulfate
16) sodium nitride

## TASK 2 - WRITING FORMULAS 1

| 1) | lead (IV) oxide |  | 11) | barium hydroxide |
| :---: | :---: | :---: | :---: | :---: |
| 2) | copper | $\ldots . . . . . . . . . . . . . . . . . . . . . . . . . . .$. | 12) | tin (IV) chloride |
| 3) | sodium | $\ldots . . . . . . . . . . . . . . . . . . . . . . . . . . .$. | 13) | silver nitrate |
| 4) | ammonium chloride |  | 14) | iodine |
| 5) | ammonia |  | 15) | nickel |
| 6) | sulfur | $\ldots . . . . . . . . . . . . . . . . . . . . . . . . . . .$. | 16) | hydrogen sulfide |
| 7) | sulfuric acid |  | 17) | titanium (IV) oxide |
| 8) | neon | ................................ | 18) | lead |
| 9) | silica |  | 19) | strontium sulfate |
| 10) | silicon | $\ldots$ | 20) | lithium |

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
20) lithium

## TASK 3 - WRITING FORMULAS 2

| 1) | silver carbonate | 11) | barium hydroxide |
| :---: | :---: | :---: | :---: |
| 2) | gold | 12) | ammonia |
| 3) | platinum (II) fluoride | 13) | hydrochloric acid |
| 4) | nitric acid | 14) | fluorine |
| 5) | ammonia | 15) | silicon |
| 6) | silicon (IV) hydride | 16) | calcium phosphate |
| 7) | phosphorus | 17) | rubidium |
| 8) | diamond | 18) | germanium (IV) oxide |
| 9) | vanadium (V) oxide | 19) | magnesium astatide |
| 10) | cobalt (II) hydroxide | 20) | nitrogen oxide |

$\qquad$
$\qquad$
$\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## 2 - EQUATIONS

From an early age you should have been able to balance chemical equations. However, at A level, you will often need to:

- work out the formulas yourselves
- work out what is made (so you need to know some basic general equations)
- for reactions involving ions in solution, write ionic equations

Some general reactions you should know:

| General Reaction | Examples |
| :---: | :---: |
| substance + oxygen $\rightarrow$ oxides | $\begin{aligned} & 2 \mathrm{Mg}+\mathrm{O}_{2} \rightarrow 2 \mathrm{MgO} \\ & 2 \mathrm{H}_{2} \mathrm{~S}+3 \mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{SO}_{2} \\ & \mathrm{C}_{3} \mathrm{H}_{8}+5 \mathrm{O}_{2} \rightarrow 3 \mathrm{CO}_{2}+4 \mathrm{H}_{2} \mathrm{O} \end{aligned}$ |
| metal + water $\rightarrow$ metal hydroxide + hydrogen | $2 \mathrm{Na}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{NaOH}+\mathrm{H}_{2}$ |
| metal + acid $\rightarrow$ salt + hydrogen | $\mathrm{Mg}+2 \mathrm{HCl} \rightarrow \mathrm{MgCl}_{2}+\mathrm{H}_{2}$ |
| oxide + acid $\rightarrow$ salt + water | $\mathrm{MgO}+2 \mathrm{HNO}_{3} \rightarrow \mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}+\mathrm{H}_{2} \mathrm{O}$ |
| hydroxide + acid $\rightarrow$ salt + water | $2 \mathrm{NaOH}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+\mathrm{H}_{2} \mathrm{O}$ |
| carbonate + acid $\rightarrow$ salt + water + carbon dioxide | $\mathrm{CuCO}_{3}+2 \mathrm{HCl} \rightarrow \mathrm{CuCl}_{2}+\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}$ |
| hydrogencarbonate + acid $\rightarrow$ salt + water + carbon dioxide | $\mathrm{KHCO}_{3}+\mathrm{HCl} \rightarrow \mathrm{KCl}+\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}$ |
| ammonia + acid $\rightarrow$ ammonium salt | $\mathrm{NH}_{3}+\mathrm{HCl} \rightarrow \mathrm{NH}_{4} \mathrm{Cl}$ |
| metal carbonate $\rightarrow$ metal oxide + carbon dioxide (on heating) | $\mathrm{CaCO}_{3} \rightarrow \mathrm{CaO}+\mathrm{CO}_{2}$ |

## TASK 4 - WRITING BALANCED EQUATIONS

1) Balance the following equations.
a) $\mathrm{Mg}+\mathrm{HNO}_{3} \rightarrow \mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}+\mathrm{H}_{2}$
b) $\mathrm{CuCl}_{2}+\mathrm{NaOH} \rightarrow \mathrm{Cu}(\mathrm{OH})_{2}+\mathrm{NaCl}$
c) $\mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow \mathrm{SO}_{3}$
d) $\mathrm{C}_{4} \mathrm{H}_{10}+\mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
2) Give balanced equations for the following reactions.
a) sodium + oxygen $\rightarrow$ sodium oxide
b) aluminium + chlorine $\rightarrow$ aluminium chloride
c) calcium + hydrochloric acid $\rightarrow$ calcium chloride + hydrogen
d) ammonia + sulphuric acid $\rightarrow$ ammonium sulphate

## TASK 5 - WRITING BALANCED EQUATIONS 2

Write balance equations for the following reactions:

1) burning aluminium
2) burning hexane $\left(\mathrm{C}_{6} \mathrm{H}_{14}\right)$
3) burning ethanethiol $\left(\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{SH}\right)$
4) reaction of lithium with water
5) reaction of calcium carbonate with nitric acid
6) thermal decomposition of lithium carbonate
7) reaction of ammonia with nitric acid
8) reaction of potassium oxide with water
9) reaction of calcium hydroxide with hydrochloric acid
10) reaction of zinc with phosphoric acid
11) reaction of sodium hydrogencarbonate with sulfuric acid
12) reaction of potassium hydroxide with sulfuric acid

## Ionic equations

When an ionic substance dissolves in water, the positive and negative ions separate and become hydrated (they interact with water molecules rather than each other). For example, a solution of sodium chloride could also be described as a mixture of hydrated sodium ions and hydrated chloride ions in water.

In reactions involving ionic compounds dissolved in water, some of the ions may not be involved in the reaction. These are called spectator ions. For such reactions, we can write an ionic equation that only shows the species that are involved in the reaction.

Simple examples are equations for which ionic equations can be written include:

## Reactions of acids:

Common ionic equations are: acid + hydroxide
acid + carbonate
acid + hydrogencarbonate
acid + ammonia

$$
\begin{aligned}
& \mathrm{H}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \\
& 2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{CO}_{3}^{2-}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{H}^{+}(\mathrm{aq})+\mathrm{HCO}_{3}^{-}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{H}^{+}(\mathrm{aq})+\mathrm{NH}_{3}(\mathrm{aq}) \rightarrow \mathrm{NH}_{4}^{+}(\mathrm{aq})
\end{aligned}
$$

We can even use these ionic equations to work out the ratio in which acids react without writing any equation.
For example, in the reaction of $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})$ with $\mathrm{NaOH}(\mathrm{aq})$ we know that one lot of $\mathrm{H}_{2} \mathrm{SO}_{4}$ contains two lots of $\mathrm{H}^{+}$ions. As $\mathrm{H}^{+}$ ions react with $\mathrm{OH}^{-}$ions in the ratio $1: 1\left[\mathrm{H}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})\right]$ we know that we need two lots of NaOH to provide two lots of $\mathrm{OH}^{-}$ions to react with the two lots of $\mathrm{H}^{+}$ions. Therefore, one lot of $\mathrm{H}_{2} \mathrm{SO}_{4}$ reacts with two lots of NaOH , i.e. the reacting ratio of $\mathrm{H}_{2} \mathrm{SO}_{4}: \mathrm{NaOH}=1: 2$

$\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})$ contains $\mathrm{H}^{+}(\mathrm{aq})$

$\mathrm{NaOH}(\mathrm{aq})$
contains $\mathrm{OH}^{-}(\mathrm{aq})$

$\mathrm{H}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
the $\mathrm{Na}^{+}(\mathrm{aq})$ and $\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$ ions are not involved

$\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})$ contains $\mathrm{H}^{+}(\mathrm{aq})$

$\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{aq})$
contains $\mathrm{CO}_{3}{ }^{2-}(\mathrm{aq})$

$$
2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{CO}_{3}^{2-}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{CO}_{2}(\mathrm{~g})
$$

the $\mathrm{Na}^{+}(\mathrm{aq})$ and $\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$ ions are not involved

## Precipitation reactions

Some salts are insoluble in water. If solutions containing those ions are mixed, the insoluble salt forms as a solid as the solutions are mixed. This solid is known as a precipitate, and the reaction as precipitation.

$\mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})$ contains $\mathrm{Ba}^{2+}(\mathrm{aq})$

$\mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})$ contains $\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$

$$
\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq}) \rightarrow \mathrm{BaSO}_{4}(\mathrm{~s})
$$

Most salts are soluble in water. Often when solutions of two salts are mixed, no such precipitation reaction will take place and the ions will remain dissolved in water.

$\mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})$

$\mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})$

Nothing happens - solutions just mix together

## TASK 6 - IONIC EQUATIONS

1) Use your knowledge of ionic equations to give the molar ratio in which the following acids react with bases. Complete the table to show your answers.

| Acid | Formula of acid | Base | Formula of base | Molar ratio of <br> acid:base |
| :---: | :---: | :---: | :---: | :---: |
| hydrochloric acid |  | lithium hydroxide |  |  |
| sulphuric acid |  | sodium hydrogencarbonate |  |  |
| nitric acid |  | ammonia |  |  |
| sulphuric acid |  | potassium carbonate |  |  |
| nitric acid |  | strontium hydroxide |  |  |

2) Write ionic equations for each of the following reactions.
a) reaction of hydrochloric acid (aq) with potassium hydroxide (aq)
b) precipitation of silver iodide from reaction between silver nitrate (aq) and potassium iodide (aq)
c) reaction of potassium carbonate (aq) with nitric acid (aq)
d) precipitation of calcium hydroxide from reaction between sodium hydroxide (aq) and calcium chloride (aq)
e) reaction of ammonia (aq) with hydrochloric acid (aq)
f) reaction of sodium hydrogencarbonate (aq) with sulfuric acid (aq)
g) precipitation of calcium sulfate from reaction between calcium chloride (aq) and sulfuric acid (aq)
h) precipitation of lead (II) chloride from reaction between lead nitrate (aq) and sodium chloride (aq)
i) reaction of barium hydroxide (aq) with nitric acid (aq)

## 3 - SIGNIFICANT FIGURES \& STANDARD FORM

## Some general rules in chemistry:

- usually give final answers to 3 significant figures (but it is best to keep the whole number on your a during the calculation)
- give $M_{r}$ 's to 1 decimal place

Note: $\quad 0.00346678=0.00347(3 \mathrm{sig}$ fig $)=3.47 \times 10^{-3}(3 \mathrm{sig}$ fig $) \quad 346678=347000(3 \mathrm{sig} \mathrm{fig})=3.47 \times 10^{5}(3 \mathrm{sig}$ fig $)$

## TASK 7 - SIGNIFICANT FIGURES \& STANDARD FORM

1) Write the following numbers to the quoted number of significant figures.
a) 345789
4 sig figs
d) 6
3 sig figs
b) 297300
3 sig figs
e) 0.001563
3 sig figs
c) 0.07896
3 sig figs
.....................
f) $0.01 \quad 4$ sig figs
2) Complete the following sums and give the answers to 3 significant figures.
a) $6125 \times 384$
b) $25.00 \times 0.01$
c) $13.5+0.18$
d) $750 \div 25$
e) $0.000152 \times 13$
f) $0.0125 \times 0.025$
3) Write the following numbers in non standard form.
a) $1.5 \times 10^{-3}$
b) $0.046 \times 10^{-2}$
c) $3.575 \times 10^{5}$
d) $0.0534 \times 10^{4}$
e) $10.3 \times 10^{5}$
f) $8.35 \times 10^{-3}$
4) Write the following numbers in standard form.
a) 0.000167
b) 0.0524
c) 0.000000015
d) 34500
e) 0.62
f) 87000000
5) Complete the following calculations and give the answers to 3 significant figures.
a) $6.125 \times 10^{-3} \times 3.5$
b) $4.3 \times 10^{-4} \div 7.0$
c) $4.0 \times 10^{8}+35000$
d) $0.00156+2.4 \times 10^{3}$
e) $6.10 \times 10^{-2}-3.4 \times 10^{-5}$
f) $8.00 \times 10^{-3} \times 0.100 \times 10^{-3}$

## 4 - THE MOLE \& AVOGADRO CONSTANT

- One mole of anything contains $6.02 \times 10^{23}$ of those things. One mole of bananas is $6.02 \times 10^{23}$ bananas. One mole of water molecules is $6.02 \times 10^{23}$ water molecules
- This number is known as the Avogadro constant.
- The Avogadro number was chosen so that the mass of one mole of particles of a substance equals the $M_{r}$ in grams. For example, the $M_{r}$ of water is 18.0, and the mass of one mole of water molecules in 18.0 grams.

Remember Mr Moles!

## TASK 8 - MOLES

1) How many moles are there in each of the following?
a) 72 g of Mg
b) 4 kg of CuO
c) 39 g of $\mathrm{Al}(\mathrm{OH})_{3}$
d) 1 tonne of NaCl
e) 20 mg of $\mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}$
2) What is the mass of each of the following?
a) 5 moles of $\mathrm{Cl}_{2}$
b) 0.2 moles of $\mathrm{Al}_{2} \mathrm{O}_{3}$
c) 0.01 moles of Ag
d) 0.002 moles of $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$
e) 0.3 moles of $\mathrm{Na}_{2} \mathrm{CO}_{3} \cdot 10 \mathrm{H}_{2} \mathrm{O}$
3) a) Calculate the number of moles of $\mathrm{CO}_{2}$ molecules in 11 g of carbon dioxide.
b) Calculate the number of moles of C atoms in 11 g of carbon dioxide.
a) Calculate the number of moles of $O$ atoms in 11 g of carbon dioxide.
4) a) Calculate the number of moles of $\mathrm{Al}_{2} \mathrm{O}_{3}$ in 5.1 g of $\mathrm{Al}_{2} \mathrm{O}_{3}$.
b) Calculate the number of moles of $\mathrm{Al}^{3+}$ ions in 5.1 g of $\mathrm{Al}_{2} \mathrm{O}_{3}$.
a) Calculate the number of moles of $\mathrm{O}^{2-}$ ions in 5.1 g of $\mathrm{Al}_{2} \mathrm{O}_{3}$.
5) An experiment was carried out to find the $M_{r}$ of vitamin $C$ (ascorbic acid). It was found that 1 g contains 0.00568 moles of Vitamin C molecules. Calculate the $\mathrm{M}_{\mathrm{r}}$ of vitamin C.
6) Use the following data to calculate the mass of the particles shown.

$$
\begin{array}{ll}
\text { Mass of proton }=1.6726 \times 10^{-24} \mathrm{~g} & \text { Mass of electron }=9.1094 \times 10^{-28} \mathrm{~g} \\
\text { Mass of neutron }=1.6749 \times 10^{-24} \mathrm{~g} & \text { Avogadro constant }=6.0221 \times 10^{23}
\end{array}
$$

a) Calculate the mass of a ${ }^{1} \mathrm{H}$ atom.
b) Calculate the mass of an ${ }^{1} \mathrm{H}^{+}$ion.
c) Calculate the mass of a ${ }^{3} \mathrm{H}$ atom.

## 5 - REACTING MASS CALCULATIONS

## What a chemical equation means

|  | + | $\infty$ <br> $\infty$ <br> $\infty$ | $\rightarrow$ |  |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{N}_{2}$ | + | $3 \mathbf{H}_{2}$ | $\rightarrow$ | $2 \mathrm{NH}_{3}$ |
| 1 molecule $\mathrm{N}_{2}$ |  | 3 molecules $\mathrm{H}_{2}$ |  | 2 molecules $\mathrm{NH}_{3}$ |
| 12 molecules $\mathrm{N}_{2}$ 1 dozen molecules $\mathrm{N}_{2}$ |  | 36 molecules $\mathrm{H}_{2}$ 3 dozen molecules $\mathrm{H}_{2}$ |  | 24 molecules $\mathrm{NH}_{3}$ <br> 2 dozen molecules $\mathrm{NH}_{3}$ |
| $\begin{aligned} & 6 \times 10^{23} \text { molecule } N_{2} \\ & 1{\text { mole } N_{2}}^{2} \end{aligned}$ |  | $\begin{gathered} 18 \times 10^{23} \text { molecules } \mathrm{H}_{2} \\ 3 \text { moles } \mathrm{H}_{2} \end{gathered}$ |  | $\begin{gathered} 12 \times 10^{23} \text { molecules } \mathrm{NH}_{3} \\ 2 \text { moles } \mathrm{NH}_{3} \end{gathered}$ |
| 10 moles $\mathrm{N}_{2}$ |  | 30 moles $\mathrm{H}_{2}$ |  | 20 moles $\mathrm{NH}_{3}$ |
| 0.5 moles $\mathrm{N}_{2}$ |  | 1.5 moles $\mathrm{H}_{2}$ |  | 1 mole $\mathrm{NH}_{3}$ |

## TASK 9 - WHAT EQUATIONS MEAN

$4 \mathrm{Na}+\mathrm{O}_{2} \quad \rightarrow \quad 2 \mathrm{Na}_{2} \mathrm{O}$

12 mol
0.1 mol
$2 \mathrm{Al}+3 \mathrm{Cl}_{2} \quad \rightarrow \quad 2 \mathrm{AlCl}_{3}$
5 mol
0.1 mol
$\mathrm{C}_{4} \mathrm{H}_{10} \quad+\quad 61 / 2 \mathrm{O}_{2} \quad \rightarrow \quad 4 \mathrm{CO}_{2} \quad+\quad 5 \mathrm{H}_{2} \mathrm{O}$
0.5 mol

20 mol
$4 \mathrm{NH}_{3}+3 \mathrm{O}_{2} \quad \rightarrow \quad 2 \mathrm{~N}_{2} \quad+\quad 6 \mathrm{H}_{2} \mathrm{O}$
0.5 mol

10 mol

## Reacting mass calculations

- You can use balanced chemical equations to find out what mass of chemicals (or volume of gases) react or are produced in a chemical reaction. To do this, calculate:
(a) moles of $\checkmark$
(b) moles of?
(c) mass of?
e.g. What mass of iron is produced when 32 kg of iron (III) oxide is heated with CO ?

$$
\begin{aligned}
& \stackrel{\checkmark}{ }(\mathrm{?} \\
& \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})+3 \mathrm{CO}(\mathrm{~g}) \rightarrow 2 \mathrm{Fe}(\mathrm{~s})+3 \mathrm{CO}_{2}(\mathrm{~g}) \\
& \text { moles of } \mathrm{Fe}_{2} \mathrm{O}_{3}=\frac{\text { mass }(\mathrm{g})}{\mathrm{M}_{\mathrm{r}}}=\frac{32,000}{159.6}=200.5 \mathrm{~mol} \\
& 1 \text { mole of } \mathrm{Fe}_{2} \mathrm{O}_{3} \text { forms } 2 \text { moles of } \mathrm{Fe} \\
\therefore & \text { moles of } \mathrm{Fe}=2 \times 200.5=401.0 \mathrm{~mol} \\
\therefore & \text { mass of } \left.\mathrm{Fe}=\text { moles } \times \mathrm{M}_{\mathrm{r}}=401.0 \times 55.8=\mathbf{2 2 , 4 0 0} \mathbf{g ~ ( 3 ~ s i g ~ f i g ~}\right)
\end{aligned}
$$

e.g. What mass of oxygen is needed to convert 102 g of ammonia into nitrogen?

```
    \(4 \mathrm{NH}_{3}(\mathrm{~g})+3 \stackrel{?}{\mathrm{O}}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{~N}_{2}(\mathrm{~g})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})\)
    moles of \(\mathrm{NH}_{3}=\frac{\text { mass }(\mathrm{g})}{\mathrm{M}_{\mathrm{r}}}=\frac{102}{17.0}=6.00 \mathrm{~mol}\)
    4 moles of \(\mathrm{NH}_{3}\) reacts with 3 moles of \(\mathrm{O}_{2} \quad \therefore 1\) mole of \(\mathrm{NH}_{3}\) reacts with \(3 / 4\) mole of \(\mathrm{O}_{2}\)
\(\therefore\) moles of \(\mathrm{O}_{2}=6.00 \times 3 / 4=4.50 \mathrm{~mol}\)
\(\therefore\) mass of \(\mathrm{O}_{2}=\) moles \(\times \mathrm{M}_{\mathrm{r}}=4.50 \times 32.0=144 \mathbf{g}\) ( \(\mathbf{3} \mathbf{~ s i g}\) fig \()\)
```

e.g. When 5.00 g of crystals of hydrated tin (II) chloride, $\mathrm{SnCl}_{2} \cdot \mathrm{xH}_{2} \mathrm{O}$, are heated, 4.20 g of anhydrous tin (II) chloride are formed. Calculate the number of molecules of water of crystallisation are in $\mathrm{SnCl}_{2} \cdot \mathrm{xH}_{2} \mathrm{O}$ (i.e. the value of x ).

```
    \(\mathrm{SnCl}_{2} \cdot \mathrm{xH}_{2} \mathrm{O} \rightarrow \mathrm{SnCl}_{2}+\mathrm{xH}_{2} \mathrm{O}\)
moles of \(\mathrm{SnCl}_{2}=\frac{\operatorname{mass}(\mathrm{g})}{\mathrm{M}_{\mathrm{r}}}=\frac{4.20}{189.7}=0.02214\) moles
```

$\therefore$ moles of $\mathrm{SnCl}_{2} \cdot \mathrm{xH}_{2} \mathrm{O}=0.02214 \mathrm{~mol}$
$\therefore \mathrm{M}_{\mathrm{r}}$ of $\mathrm{SnCl}_{2} \cdot \mathrm{xH}_{2} \mathrm{O}=\frac{\text { mass }}{\text { moles }}=\frac{5.00}{0.02214}=225.8$
$\therefore \quad \mathrm{M}_{\mathrm{r}}$ of $\mathrm{xH}_{2} \mathrm{O}=225.8-189.7=36.1$
$\therefore x=\frac{36.1}{18.0}=2(x$ is a whole number $)$

## TASK 10 - REACTING MASS CALCULATIONS 1

1) What mass of hydrogen is needed to react with 40 g of copper oxide?
$\mathrm{CuO}+\mathrm{H}_{2} \rightarrow \mathrm{Cu}+\mathrm{H}_{2} \mathrm{O}$
2) What mass of oxygen reacts with 192 g of magnesium?
$2 \mathrm{Mg}+\mathrm{O}_{2} \rightarrow 2 \mathrm{MgO}$
3) What mass of sulfur trioxide is formed from 96 g of sulfur dioxide?
$2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{3}$
4) What mass of carbon monoxide is needed to react with 480 kg of iron oxide?

$$
\mathrm{Fe}_{2} \mathrm{O}_{3}+3 \mathrm{CO} \rightarrow 2 \mathrm{Fe}+3 \mathrm{CO}_{2}
$$

5) What mass of carbon dioxide is produced when 5.6 g of butene is burnt.
$\mathrm{C}_{4} \mathrm{H}_{8}+6 \mathrm{O}_{2} \rightarrow 4 \mathrm{CO}_{2}+4 \mathrm{H}_{2} \mathrm{O}$
6) What mass of oxygen is needed to react with 8.5 g of hydrogen sulphide $\left(\mathrm{H}_{2} \mathrm{~S}\right)$ ?
$2 \mathrm{H}_{2} \mathrm{~S}+3 \mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$
7) 4.92 g of hydrated magnesium sulphate crystals $\left(\mathrm{MgSO}_{4} \cdot \mathrm{nH}_{2} \mathrm{O}\right)$ gave 2.40 g of anhydrous magnesium sulphate on heating to constant mass. Work out the formula mass of the hydrated magnesium sulphate and so the value of $n$.
$\mathrm{MgSO}_{4} \cdot n \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{MgSO}_{4}+n \mathrm{H}_{2} \mathrm{O}$
8) In an experiment to find the value of $x$ in the compound $\mathrm{MgBr}_{2} \cdot \mathrm{xH}_{2} \mathrm{O}, 7.30 \mathrm{~g}$ of the compound on heating to constant mass gave 4.60 g of the anhydrous salt $\mathrm{MgBr}_{2}$. Find the value of $x$.
$\mathrm{MgBr}_{2} \cdot \mathrm{XH}_{2} \mathrm{O} \rightarrow \mathrm{MgBr}_{2}+x \mathrm{H}_{2} \mathrm{O}$
9) What mass of glucose must be fermented to give 5.00 kg of ethanol?
$\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \rightarrow 2 \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}+2 \mathrm{CO}_{2}$
10) The pollutant sulfur dioxide can removed from the air by reaction with calcium carbonate in the presence of oxygen. What mass of calcium carbonate is needed to remove 1 ton of sulfur dioxide?
$2 \mathrm{CaCO}_{3}+2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{CaSO}_{4}+2 \mathrm{CO}_{2}$
11) What mass of potassium oxide is formed when 7.8 mg of potassium is burned in oxygen?
$4 \mathrm{~K}+\mathrm{O}_{2} \rightarrow 2 \mathrm{~K}_{2} \mathrm{O}$
12) What mass of hydrogen is produced when 10.0 g of aluminium reacts with excess hydrochloric acid?
$2 \mathrm{Al}+6 \mathrm{HCl} \rightarrow 2 \mathrm{AlCl}_{3}+3 \mathrm{H}_{2}$
13) What mass of sodium just reacts with 40.0 g of oxygen?
$4 \mathrm{Na}+\mathrm{O}_{2} \rightarrow 2 \mathrm{Na}_{2} \mathrm{O}$
14) What mass of nitrogen is produced when 2.00 tonnes of ammonia gas decomposes?
$2 \mathrm{NH}_{3} \rightarrow \mathrm{~N}_{2}+3 \mathrm{H}_{2}$
15) What mass of oxygen is produced when 136 g of hydrogen peroxide molecules decompose?
$2 \mathrm{H}_{2} \mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}+\mathrm{O}_{2}$
16) What mass of lead (II) oxide is produced when 0.400 moles of lead (II) nitrate decomposes?
$2 \mathrm{~Pb}\left(\mathrm{NO}_{3}\right)_{2} \rightarrow 2 \mathrm{PbO}+4 \mathrm{NO}_{2}+\mathrm{O}_{2}$

## Limiting reagents

- In the real world of chemistry, it is rare that we react the exact right amount of chemicals together. Usually, we have more than we need of one of the reactants and so it doesn't all react - it is in excess.
- Sometimes in calculations, we need to work out if one of the reactants is in excess. The reactant that is not in excess is sometimes called the limiting reagent.
e.g. 1 - Starting point - Working out how much reacts in terms of moles: $\quad 2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{3}$

| Moles at the start |  | Moles reacting |  | Reagent in <br> excess | Moles at the end |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Moles $\mathrm{SO}_{2}$ | Moles $\mathrm{O}_{2}$ | Moles $\mathrm{SO}_{2}$ | Moles $\mathrm{O}_{2}$ |  | Moles $\mathrm{SO}_{2}$ | Moles $\mathrm{O}_{2}$ | Moles $\mathrm{SO}_{3}$ |
| 4 | 3 | 4 | 2 | $\mathrm{O}_{2}$ | 0 | 1 | 4 |
| 10 | 10 |  |  |  |  |  |  |
| 0.1 | 0.02 |  |  |  |  |  |  |
| 2 | 0.4 |  |  |  |  |  |  |
| 2 | 10 |  |  |  |  |  |  |

And then you usually have to work out the mass of one of the substances.
e.g. $2 \mathrm{Ba}(\mathrm{OH})_{2}+2 \mathrm{HCl} \rightarrow \mathrm{BaCl}_{2}+2 \mathrm{H}_{2} \mathrm{O}$

| Moles at the start |  | Moles reacting |  | Reagent in excess | Moles at the end |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{Mol} \mathrm{Ba}(\mathrm{OH})_{2}$ | Moles HCl | Mol $\mathrm{Ba}(\mathrm{OH})_{2}$ | Moles HCl |  | Mol $\mathrm{Ba}(\mathrm{OH})_{2}$ | Moles HCl | Moles $\mathrm{BaCl}_{2}$ |
| 5 | 5 | 2.5 | 5 | $\mathrm{Ba}(\mathrm{OH})_{2}$ |  |  |  |
| 0.1 | 0.05 |  |  |  |  |  |  |
| 0.2 | 0.5 |  |  |  |  |  |  |
| 0.025 | 0.0375 |  |  |  |  |  |  |

e.g. 3 In the manufacture of titanium, what mass of titanium can theoretically be formed when 1 kg of titanium chloride reacts with 0.1 kg of magnesium?

$$
\mathrm{TiCl}_{4}+2 \mathrm{Mg} \rightarrow \mathrm{Ti}+2 \mathrm{MgCl}_{2}
$$

Moles $\mathrm{TiCl}_{4}=\frac{1000}{189.9}=5.266 \quad$ Moles $\mathrm{Mg}=\frac{100}{24.3}=4.115$
5.266 moles of $\mathrm{TiCl}_{4}$ needs 10.53 moles of Mg to react,
$\therefore \mathrm{TiCl}_{4}$ is in XS and does not all react, so Mg is the limiting reagent
$\therefore 2.058$ moles of $\mathrm{TiCl}_{4}$ reacts with 4.115 moles of Mg
$\therefore 2.058$ moles of Ti is produced
Mass of $\mathrm{Ti}=2.058 \times 47.9=98.6 \mathrm{~g}$

## TASK 11 - REACTING MASS CALCULATIONS 2

1) In each case work out the limiting reagent and moles of ammonia formed (assuming complete reaction).

$$
\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightarrow 2 \mathrm{NH}_{3}
$$

a) 3 moles of $\mathrm{N}_{2}+3$ moles of $\mathrm{H}_{2}$
b) 3 moles of $\mathrm{N}_{2}+10$ moles of $\mathrm{H}_{2}$
c) 0.1 moles of $\mathrm{N}_{2}+0.2$ moles of $\mathrm{H}_{2}$
d) 0.5 moles of $\mathrm{N}_{2}+2.0$ moles of $\mathrm{H}_{2}$
e) 2 moles of $\mathrm{N}_{2}+10$ moles of $\mathrm{H}_{2}$
2) In each case work out the limiting reagent and moles of sulphur dioxide formed (assuming complete reaction).

$$
2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{3}
$$

a) 3 moles of $\mathrm{SO}_{2}+3$ moles of $\mathrm{O}_{2}$
b) 3 moles of $\mathrm{SO}_{2}+2$ moles of $\mathrm{O}_{2}$
c) 0.1 moles of $\mathrm{SO}_{2}+0.02$ moles of $\mathrm{O}_{2}$
d) 2.0 moles of $\mathrm{SO}_{2}+0.4$ moles of $\mathrm{O}_{2}$
e) 2 moles of $\mathrm{SO}_{2}+10$ moles of $\mathrm{O}_{2}$
3) 5.00 g of iron and 5.00 g of sulphur are heated together to form iron (II) sulphide. Which reactant is in excess and what is the maximum mass of iron (II) sulphide that can be formed?
$\mathrm{Fe}+\mathrm{S} \rightarrow \mathrm{FeS}$
4) In the manufacture of the fertiliser ammonium sulphate, what is the maximum mass of ammonium sulphate that can be obtained from 2.00 kg of sulphuric acid and 1.00 kg of ammonia?
$\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NH}_{3} \rightarrow\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$
5) In the Solvay process, ammonia is recovered by the reaction shown. What is the maximum mass of ammonia that can be recovered from 2 tonnes of ammonium chloride and 0.5 tonnes of calcium oxide?
$2 \mathrm{NH}_{4} \mathrm{Cl}+\mathrm{CaO} \rightarrow \mathrm{CaCl}_{2}+\mathrm{H}_{2} \mathrm{O}+2 \mathrm{NH}_{3}$
6) In the manufacture of titanium, what mass of titanium can theoretically be formed when 0.5 kg of titanium chloride reacts with 0.1 kg of magnesium?
$\mathrm{TiCl}_{4}+2 \mathrm{Mg} \rightarrow \mathrm{Ti}+2 \mathrm{MgCl}_{2}$
7) In the manufacture of ammonia, what mass of ammonia can theoretically be formed when 1 kg of nitrogen reacts with 0.5 kg of hydrogen?
$\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightarrow 2 \mathrm{NH}_{3}$
8) In the manufacture of sulphur troxide, what mass of sulphur trioxide can theoretically be formed when 1 kg of sulphur dioxide reacts with 0.5 kg of oxygen?
$2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{3}$
9) Hydrazine $\left(\mathrm{N}_{2} \mathrm{H}_{4}\right)$ was used as the rocket fuel for the Apollo missions to the moon. It is by reaction of ammonia with sodium chlorate. What mass of hydrazine is made by reaction of 100 g of ammonia with 100 g of sodium chloriate?
$2 \mathrm{NH}_{3}+\mathrm{NaOCl} \rightarrow \mathrm{N}_{2} \mathrm{H}_{4}+\mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$

## Yields

- When you make a new substance by a chemical reaction, you may not get all the expected amount of product. For example, if you reacted 4 g of hydrogen with 32 g of oxygen, you may get less than 36 g of water. Reasons include:
- the reaction may be reversible (both the forwards and backwards reaction can take place)
- some of the product may be lost when it is separated from the reaction mixture
- some of the reactants may react in other reactions.

```
% yield = mass of product obtained x 100
    maximum theoretical mass of product
```

e.g. Iron is extracted from iron oxide in the Blast Furnace as shown. $\mathrm{Fe}_{2} \mathrm{O}_{3}+3 \mathrm{CO} \rightarrow 2 \mathrm{Fe}+3 \mathrm{CO}_{2}$
a) Calculate the maximum theoretical mass of iron that can be made from 1 tonne of iron oxide.

$$
\begin{aligned}
& \text { Moles of } \mathrm{Fe}_{2} \mathrm{O}_{3}=\frac{\operatorname{mass}(\mathrm{g})}{\mathrm{M}_{r}}=\frac{1,000,000}{159.6}=6266 \text { moles } \\
\therefore & \text { moles of } \mathrm{Fe}=2 \times 6266=12530 \mathrm{~mol} \\
\therefore & \text { mass of } \left.\mathrm{Fe}=\text { moles } \times \mathrm{M}_{r}=12530 \times 55.8=\mathbf{6 9 9 0 0 0} \mathbf{g ~ ( 3 ~ s i g ~ f i g}\right)
\end{aligned}
$$

b) In the reaction, only 650000 g of iron was made. Calculate the percentage yield.

$$
\% \text { Yield }=\underset{\text { theoretical mass expected }}{\frac{\text { mass actually made }}{} \times 100=\frac{650000}{699000} \times 100=93.0 \%}
$$

## TASK 12 - PERCENTAGE YIELD

1) Sulfur dioxide reacts with oxygen to make sulfur trioxide. $2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{3}$
a) Calculate the maximum theoretical mass of sulfur trioxide that can be made by reacting 96 g of sulfur dioxide with an excess of oxygen.
b) In the reaction, only 90 g of sulfur trioxide was made. Calculate the percentage yield.
c) Give three reasons why the amount of sulfur trioxide made is less than the maximum theoretical maximum.
2) Iron is extracted from iron oxide in the Blast Furnace as shown. $\mathrm{Fe}_{2} \mathrm{O}_{3}+3 \mathrm{CO} \rightarrow 2 \mathrm{Fe}+3 \mathrm{CO}_{2}$
a) Calculate the maximum theoretical mass of iron that can be made from 1 tonne of iron oxide.
b) In the reaction, only 650000 g of iron was made. Calculate the percentage yield.
3) Nitrogen reacts with hydrogen to make ammonia. $\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightarrow 2 \mathrm{NH}_{3}$
a) Calculate the maximum theoretical mass of ammonia that can be made by reacting 90 g of hydrogen with an excess of nitrogen.
b) In the reaction, only 153 g of ammonia was produced. Calculate the percentage yield.
4) Titanium can be extracted from titanium chloride by the following reaction. $\mathrm{TiCl}_{4}+2 \mathrm{Mg} \rightarrow \mathrm{Ti}+2 \mathrm{MgCl}_{2}$
a) Calculate the maximum theoretical mass of titanium that can be extracted from 100 g of titanium chloride .
b) In the reaction, only 20 g of titanium was made. Calculate the percentage yield.
c) Give three reasons why the amount of titanium made is less than the maximum theoretical maximum.
5) Aluminium is extracted from aluminium oxide in the following reaction. $2 \mathrm{Al}_{2} \mathrm{O}_{3} \rightarrow 4 \mathrm{Al}+3 \mathrm{O}_{2}$
a) Calculate the maximum theoretical mass of aluminium that can be made from 1 kg of aluminium oxide.
b) In the reaction, only 500 g of aluminium was made. Calculate the percentage yield.
6) The fertiliser ammonium sulpfate is made as follows. $2 \mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$
a) Calculate the maximum theoretical mass of ammonium sulfate that can be made by reacting 85 g of ammonia with an excess of sulfuric acid.
b) In the reaction, only 300 g of ammonium sulfate was produced. Calculate the percentage yield.
7) 0.8500 g of hexanone, $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}$, is converted into its 2,4 -dinitrophenylhyrazone during its analysis. After isolation and purification, 2.1180 g of product $\mathrm{C}_{12} \mathrm{H}_{18} \mathrm{~N}_{4} \mathrm{O}_{4}$ are obtained. Calculate the percentage yield.

## Atom Economy

- Atom economy is a measure of what proportion of the products of a reaction are the desired product and how much is waste. The higher the atom economy, the less waste that is produced.

```
Atom economy = mass of wanted product from equation }\times10
    total mass of products from equation
```

e.g. making ethanol by
fermentation

| glucose |
| :--- |
| $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}(\mathrm{aq})$ |
| 180 g | $\rightarrow$| ethanol |
| :---: |
| $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{aq})+2 \mathrm{CO}_{2}$ |
| 92 g |
| 880 g products |

Atom economy $=\frac{92}{180} \times 100=51 \%$
Only 92 g of the 180 g of products is ethanol. This means that $51 \%$ of the mass of the products is ethanol, while the other $49 \%$ is waste.

## TASK 13 - ATOM ECONOMY

1) Calculate the atom economy to make sodium from sodium

$$
2 \mathrm{NaCl} \rightarrow 2 \mathrm{Na}+\mathrm{Cl}_{2}
$$ chloride.

2) Calculate the atom economy to make hydrogen from the reaction of zinc with hydrochloric acid.
3) Calculate the atom economy to make iron from iron oxide in the Blast Furnace.

$$
\mathrm{Fe}_{2} \mathrm{O}_{3}+3 \mathrm{CO} \rightarrow 2 \mathrm{Fe}+3 \mathrm{CO}_{2}
$$

4) Calculate the atom economy to make calcium oxide from calcium carbonate.
5) Calculate the atom economy to make sulfur trioxide from sulfur dioxide.
6) Calculate the atom economy to make oxygen from hydrogen peroxide.

$$
\mathrm{Zn}+2 \mathrm{HCl} \rightarrow \mathrm{ZnCl}_{2}+\mathrm{H}_{2}
$$

$$
\mathrm{CaCO}_{3} \rightarrow \mathrm{CaO}+\mathrm{CO}_{2}
$$

$$
2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{3}
$$

$$
2 \mathrm{H}_{2} \mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}+\mathrm{O}_{2}
$$

7) Hydrazine $\left(\mathrm{N}_{2} \mathrm{H}_{4}\right)$ was used as the rocket fuel for the Apollo missions to the moon. It is by reaction of ammonia $\left(\mathrm{NH}_{3}\right)$ with sodium chlorate $(\mathrm{NaOCl})$.

$$
\begin{aligned}
& \text { ammonia + sodium chlorate } \rightarrow \text { hydrazine + sodium chloride + water } \\
& 2 \mathrm{NH}_{3}+\mathrm{NaOCl} \rightarrow \mathrm{~N}_{2} \mathrm{H}_{4}+\mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

a) Calculate the maximum theoretical mass of hydrazine that can be made by reacting 340 g of ammonia with an excess of sodium chlorate.
b) In the reaction, only 280 g of hydrazine was produced. Calculate the percentage yield.
c) Calculate the atom economy for this way of making hydrazine.
d) Explain clearly the difference between atom economy and percentage yield.

## 6 - GAS CALCULATIONS

## THE IDEAL GAS EQUATION

| PV | RT | $\begin{aligned} & \mathrm{P}=\text { pressure }(\mathrm{Pa}) \\ & \mathrm{V}=\text { volume }\left(\mathrm{m}^{3}\right) \end{aligned}$ | $\begin{aligned} & \mathrm{n}=\text { number of moles } \\ & \mathrm{R}=\text { gas constant }\left(8.31 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right) \\ & \mathrm{T}=\text { temperature }(\mathrm{K}) \end{aligned}$ |  |
| :---: | :---: | :---: | :---: | :---: |
| Volume |  | Pressure |  | Temperature |
| $\frac{\mathrm{dm}^{3}}{1000}=\mathrm{m}^{3}$ | $10 \frac{\mathrm{~cm}^{3}}{00000}=\mathrm{m}^{3}$ | $\mathrm{kPa} \times 1000=\mathrm{Pa}$ | $\mathrm{MPa} \times 1000000=\mathrm{Pa}$ | ${ }^{\circ} \mathrm{C}+273=\mathrm{K}$ |

e.g. Calculate the pressure exerted by 0.100 moles of an ideal gas at $50^{\circ} \mathrm{C}$ with a volume of $1500 \mathrm{~cm}^{3}$.

$$
P=\frac{n R T}{V}=\frac{0.100 \times 8.31 \times 323}{1500 / 1000000}=179000 \mathrm{~Pa}(3 \mathrm{sf})
$$

## TASK 14 - THE IDEAL GAS EQUATION

1) Convert the following into SI units.
a) $200^{\circ} \mathrm{C}$
b) 98 kPa
c) $50 \mathrm{~cm}^{3}$
d) $-50^{\circ} \mathrm{C}$
e) 0.1 MPa
f) $3.2 \mathrm{dm}^{3}$
2) Calculate the volume that 0.400 moles of an ideal gas occupies at $100^{\circ} \mathrm{C}$ and a pressure of 1000 kPa .
3) How many moles of gas occupy $19400 \mathrm{~cm}^{3}$ at $27^{\circ} \mathrm{C}$ and 1 atm pressure?
4) Calculate the pressure that 0.05 moles of gas, which occupies a volume of $200 \mathrm{~cm}^{3}$, exerts at a temperature of 50 K .
5) 0.140 moles of a gas has a volume of $2.00 \mathrm{dm}^{3}$ at a pressure of 90 kPa . Calculate the temperature of the gas.
6) At 273 K and $101000 \mathrm{~Pa}, 6.319 \mathrm{~g}$ of a gas occupies $2.00 \mathrm{dm}^{3}$. Calculate the relative molecular mass of the gas.
7) Find the volume of ethyne $\left(\mathrm{C}_{2} \mathrm{H}_{2}\right)$ that can be prepared from 10.0 g of calcium carbide at $20^{\circ} \mathrm{C}$ and 100 kPa .
$\mathrm{CaC}_{2}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq})+\mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})$
8) What mass of potassium chlorate $(\mathrm{V})$ must be heated to give $1.00 \mathrm{dm}^{3}$ of oxygen at $20^{\circ} \mathrm{C}$ and 0.1 MPa .

$$
2 \mathrm{KClO}_{3}(\mathrm{~s}) \rightarrow 2 \mathrm{KCl}(\mathrm{~s})+3 \mathrm{O}_{2}(\mathrm{~g})
$$

9) What volume of hydrogen gas, measured at 298 K and 100 kPa , is produced when 1.00 g of sodium is reacted with excess water?
$2 \mathrm{Na}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{NaOH}+\mathrm{H}_{2}$
10) What volume of carbon dioxide gas, measured at 800 K and 100 kPa , is formed when 1 kg of propane is burned in a good supply of oxygen?
$\mathrm{C}_{3} \mathrm{H}_{8}+5 \mathrm{O}_{2} \rightarrow 3 \mathrm{CO}_{2}+4 \mathrm{H}_{2} \mathrm{O}$
11) Calculate the relative molecular mass of a gas which has a density of $2.615 \mathrm{~g} \mathrm{dm}^{-3}$ at 298 K and 101 kPa .
12) A certain mass of an ideal gas is in a sealed vessel of volume $3.25 \mathrm{dm}^{3}$. At a temperature of $25^{\circ} \mathrm{C}$ it exerts a pressure of 101 kPa . What pressure will it exert at $100^{\circ} \mathrm{C}$ ?
13) An ideal gas occupies a volume of $2.75 \mathrm{dm}^{3}$ at 290 K and $8.7 \times 10^{4} \mathrm{~Pa}$. At what temperature will it occupy $3.95 \mathrm{dm}^{3}$ at $1.01 \times 10^{5} \mathrm{~Pa}$ ?

## REACTING GAS VOLUMES

- The volume of a gas depends on the temperature, pressure and number of moles. What the gas is does not affect its volume.
- This means that under the same conditions of temperature and pressure, $100 \mathrm{~cm}^{3}$ (as an example) of one gas contains the same number of moles as $100 \mathrm{~cm}^{3}$ of any other gas.
e.g. What volume of oxygen reacts with $100 \mathrm{~cm}^{3}$ of but-1-ene?
$\mathrm{C}_{4} \mathrm{H}_{8}(\mathrm{~g})+6 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 4 \mathrm{CO}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Answer $=600 \mathrm{~cm}^{3}$
e.g. $1 \mathrm{dm}^{3}$ of but-1-ene is reacted with $10 \mathrm{dm}^{3}$ of oxygen. What volume of oxygen remains at the end?
$\mathrm{C}_{4} \mathrm{H}_{8}(\mathrm{~g})+6 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 4 \mathrm{CO}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$6 \mathrm{dm}^{3}$ of $\mathrm{O}_{2}$ reacts with $1 \mathrm{dm}^{3}$ of but-1-ene $\therefore 4 \mathrm{dm}^{3}$ of oxygen is left over

## TASK 15 - REACTING GAS VOLUMES

1) What volume of oxygen is required to burn the following gases, and what volume of carbon dioxide is produced?
a) $1 \mathrm{dm}^{3}$ of methane
b) $20 \mathrm{~cm}^{3}$ of butene
c) $500 \mathrm{~cm}^{3}$ of ethyne
d) $750 \mathrm{~cm}^{3}$ of benzene
$\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
$\mathrm{C}_{4} \mathrm{H}_{8}(\mathrm{~g})+6 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 4 \mathrm{CO}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
$2 \mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})+5 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 4 \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$2 \mathrm{C}_{6} \mathrm{H}_{6}(\mathrm{~g})+15 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 12 \mathrm{CO}_{2}(\mathrm{~g})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
2) When $100 \mathrm{~cm}^{3}$ of hydrogen bromide reacts with $80 \mathrm{~cm}^{3}$ of ammonia, a white solid is formed and some gas is left over. What gas and how much of it is left over?

$$
\mathrm{NH}_{3}(\mathrm{~g})+\mathrm{HBr}(\mathrm{~g}) \rightarrow \mathrm{NH}_{4} \mathrm{Br}(\mathrm{~s})
$$

3) $100 \mathrm{~cm}^{3}$ of methane was reacted with $500 \mathrm{~cm}^{3}$ of oxygen. What is the total volume of all gases at the end, and indicate how much there is of each gas?

$$
\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})
$$

4) If $4 \mathrm{dm}^{3}$ of hydrogen sulphide is burned in $10 \mathrm{dm}^{3}$ of oxygen, what is the final volume of the mixture (give the volume of each gas at the end)?

$$
2 \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+2 \mathrm{SO}_{2}(\mathrm{~g})
$$

1) A gas has a density of $1.655 \mathrm{~g} \mathrm{dm}^{-3}$ at 323 K and $1.01 \times 10^{5} \mathrm{~Pa}$. Calculate the $\mathrm{M}_{\mathrm{r}}$ of the gas.
2) One method used to inflate air bags in cars is to use nitrogen produced chemically from the decomposition of sodium azide. The sodium formed reacts with potassium nitrate to give more nitrogen.

$$
\begin{aligned}
2 \mathrm{NaN}_{3}(\mathrm{~s}) & \rightarrow 2 \mathrm{Na}(\mathrm{~s})+3 \mathrm{~N}_{2}(\mathrm{~g}) \\
10 \mathrm{Na}(\mathrm{~s})+2 \mathrm{KNO}_{3}(\mathrm{~s}) & \rightarrow \mathrm{K}_{2} \mathrm{O}(\mathrm{~s})+5 \mathrm{Na}_{2} \mathrm{O}(\mathrm{~s})+\mathrm{N}_{2}(\mathrm{~g})
\end{aligned}
$$

a) In what ratio (by mass) must the sodium azide and potassium nitrate be mixed in order that no metallic sodium remains after the reaction?
b) Calculate the total mass of the solid mixture needed to inflate a $60 \mathrm{dm}^{3}$ air bag at room temperature and atmospheric pressure.
3) $\quad 1.00 \mathrm{~g}$ of sulphur dissolved completely in an excess of liquid ammonia to give $420 \mathrm{~cm}^{3}$ of hydrogen sulphide $\left(\mathrm{H}_{2} \mathrm{~S}\right)$, measured at 273 K and 101 kPa , and also a solid containing the elements nitrogen and sulphur. Deduce the empirical formula of the solid.
4) When $15 \mathrm{~cm}^{3}$ of a gaseous hydrocarbon was exploded with $60 \mathrm{~cm}^{3}$ of oxygen (an XS), the final volume was 45 $\mathrm{cm}^{3}$. This decreased to $15 \mathrm{~cm}^{3}$ on treatment with NaOH solution (removes $\mathrm{CO}_{2}$ ). What was the formula of the hydrocarbon? (all measurements were made at room temperature and pressure, $\therefore$ the water produced is a liquid).
5) Find the equation to calculate the root mean square velocity of gas particles. Once you have that equation, use it to calculate the root mean square velocity for nitrogen molecules at 298 K and 100 kPa .
6) $10 \mathrm{~cm}^{3}$ of a hydrocarbon, $\mathrm{C}_{\mathrm{x}} \mathrm{H}_{\mathrm{y}}$, were exploded with an excess of oxygen. There was a contraction in volume of $30 \mathrm{~cm}^{3}$. When the products were treated with sodium hydroxide (which reacts with carbon dioxide), there was a further contraction of $30 \mathrm{~cm}^{3}$. Deduce the formula of the hydrocarbon, given that all volumes were measured under the same conditions.

## Should I get a Health Checkup?

1) Give the formula of each of the following substances.
a) zinc nitrate
e) phosphorus
b) lead
f) nitrogen
c) chromium (III) oxide
g) barium hydroxide
d) ammonium sulphate
h) aluminium sulphate
2) Use your knowledge of ionic equations to give the molar ratio in which the following acids react with bases. Complete the table to show your answers.

| Acid | Formula of acid | Base | Formula of base | Molar ratio of <br> acid:base |
| :---: | :---: | :---: | :---: | :---: |
| sulphuric acid |  | potassium hydroxide |  |  |
| hydrochloric acid |  | potassium hydrogencarbonate |  |  |
| nitric acid |  | ammonia |  |  |
| hydrochloric acid |  | zinc carbonate |  |  |

3) Write ionic equations for each of the following reactions.
a) reaction of sulphuric acid (aq) and sodium hydroxide (aq)
$\qquad$
b) precipitation of barium carbonate by mixing solutions of barium hydroxide and sodium carbonate
$\qquad$
c) reaction of nitric acid (aq) and ammonia (aq)
$\qquad$
d) reaction of sulphuric acid (aq) and potassium hydrogencarbonate (aq)
$\qquad$
4) a) Define the term relative atomic mass. $\qquad$
$\qquad$
b) Explain why ${ }^{12} \mathrm{C}$ is referred to in the definition.
$\qquad$
c) Explain why carbon has a relative atomic mass of 12.011 and not exactly 12.000 .
$\qquad$
5) In each case work out the limiting reagent and moles of ammonia formed (assuming complete reaction).

$$
\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightarrow 2 \mathrm{NH}_{3}
$$

a) 5 moles of $\mathrm{N}_{2}+5$ moles of $\mathrm{H}_{2}$
moles of $\mathrm{NH}_{3}$ formed $=$ $\qquad$
b) 2 moles of $\mathrm{N}_{2}+5$ moles of $\mathrm{H}_{2} \quad$ moles of $\mathrm{NH}_{3}$ formed $=$ $\qquad$
c) 10 moles of $\mathrm{N}_{2}+50$ moles of $\mathrm{H}_{2}$ moles of $\mathrm{NH}_{3}$ formed $=$ $\qquad$
d) 0.2 moles of $\mathrm{N}_{2}+0.05$ moles of $\mathrm{H}_{2} \quad$ moles of $\mathrm{NH}_{3}$ formed $=$ $\qquad$
6) Calculate the volume of 0.200 moles of carbon dioxide at $100^{\circ} \mathrm{C}$ and 2 MPa pressure.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
7) Calculate the number of moles of argon in $200 \mathrm{~cm}^{3}$ at 100 kPa at $20^{\circ} \mathrm{C}$.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
8) The equation is for the combustion of ethane in oxygen. $\mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})+31 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{CO}_{2}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

What volume of carbon dioxide is formed and what is the total volume of gases at the end in each of the following reactions.
a) $100 \mathrm{~cm}^{3}$ of ethane $+100 \mathrm{~cm}^{3}$ of oxygen volume of $\mathrm{CO}_{2}$ formed $=$ $\qquad$ Total volume of gases at end $=$
b) $100 \mathrm{~cm}^{3}$ of ethane $+500 \mathrm{~cm}^{3}$ of oxygen volume of $\mathrm{CO}_{2}$ formed $=$ $\qquad$ Total volume of gases at end $=$ $\qquad$
c) $200 \mathrm{~cm}^{3}$ of ethane $+400 \mathrm{~cm}^{3}$ of oxygen volume of $\mathrm{CO}_{2}$ formed $=$ $\qquad$ Total volume of gases at end $=$ $\qquad$
9) What volume of hydrogen is formed at $20^{\circ} \mathrm{C}$ and 100000 Pa pressure when 2 g of magnesium is reacted with excess sulphuric acid?

$$
\mathrm{Mg}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \rightarrow \mathrm{MgSO}_{4}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})
$$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
10) What volume of carbon monoxide is formed at $1200^{\circ} \mathrm{C}$ and 0.14 MPa pressure when 1 kg of iron oxide is reduced by carbon?

$$
\mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})+3 \mathrm{C}(\mathrm{~s}) \rightarrow 2 \mathrm{Fe}(\mathrm{l})+3 \mathrm{CO}(\mathrm{~g})
$$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
11) a) In 20 moles of $\mathrm{Al}_{2} \mathrm{O}_{3}$,
i) how many moles of $\mathrm{Al}^{3+}$ ions?
ii) how many moles of $\mathrm{O}^{2-}$ ions?
b) In 360 g of water
i) how many moles of H atoms?
ii) how many moles of O atoms?
c) In 1 kg of aluminium sulphate
i) how many moles of aluminium ions?
ii) how many moles of sulphate ions?
12) What mass of $\mathrm{Fe}_{3} \mathrm{O}_{4}$ is produced when 140 g of iron reacts with excess steam?

$$
3 \mathrm{Fe}(\mathrm{~s})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \rightarrow \mathrm{Fe}_{3} \mathrm{O}_{4}(\mathrm{~s})+4 \mathrm{H}_{2}(\mathrm{~g})
$$

$\qquad$
$\qquad$
$\qquad$
13) What mass of potassium oxide is formed when 7.8 g of potassium is burned in oxygen?

$$
4 \mathrm{~K}+\mathrm{O}_{2} \rightarrow 2 \mathrm{~K}_{2} \mathrm{O}
$$

$\qquad$
$\qquad$
$\qquad$
14) a) Sulfur trioxide is made from sulfur dioxide by the following reaction. Calculate the maximum amount of sulfur trioxide that can be made from 1 kg of sulfur dioxide.

$$
2 \mathrm{SO}_{2}+\mathrm{O}_{2}-2 \mathrm{SO}_{3}
$$

$\qquad$
$\qquad$
$\qquad$
b) In an experiment, only 1200 g of sulfur trioxide was produced.
i) Calculate the percentage yield.
ii) Give three reasons why the yield is less than $100 \%$.
$\qquad$
$\qquad$
$\qquad$
c) Calculate the atom economy for this process.
15) a) Aluminium is made from aluminium oxide by electrolysis. Calculate the mass of aluminium that can be made from 1 kg of aluminium oxide.

$$
2 \mathrm{Al}_{2} \mathrm{O}_{3} \rightarrow 4 \mathrm{Al}+3 \mathrm{O}_{2}
$$

$\qquad$
$\qquad$
$\qquad$
b) Calculate the percentage yield if 500 g of aluminium is produced.
$\qquad$
c) Calculate the atom economy for this process.
$\qquad$
16) When 12.3 g of $\mathrm{MgSO}_{4} . \mathrm{nH}_{2} \mathrm{O}$ is heated gently until no further change in mass occurs, to remove the water of crystallisation, 6.0 g of anhydrous magnesium sulfate $\left(\mathrm{MgSO}_{4}\right)$ remained. Work out the relative formula mass $\left(\mathrm{M}_{\mathrm{r}}\right)$ of the $\mathrm{MgSO}_{4} \cdot n \mathrm{H}_{2} \mathrm{O}$, and so the value of $n$.

$$
\mathrm{MgSO}_{4} . n \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{MgSO}_{4}+n \mathrm{H}_{2} \mathrm{O}
$$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
17) Since 1850, most books and documents have been printed on acidic paper which, over time, becomes brittle and disintegrates. By treating books with diethyl zinc vapour, the acids in the book are neutralised. Diethyl zinc vapour penetrates the closed book and reacts with the small amount of water in the paper to form zinc oxide. The zinc oxide neutralises the acids and protects the book from acids that may be formed later. There is virtually no difference between treated and untreated books.

The reaction between diethyl zinc and water is represented by the equation:

$$
\mathrm{Zn}\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{ZnO}(\mathrm{~s})+2 \mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})
$$

The total moisture content of a book which was treated was found to be 0.9 g of water.
a) i) How many moles of water were present in the book?
ii) Using the equation, how many moles of diethyl zinc would react with this amount of water?
$\qquad$
iii) What is the volume at room temperature and pressure of this amount of diethyl zinc vapour?
$\qquad$
$\qquad$
$\qquad$
iv) What mass of zinc oxide would be formed in the book?
$\qquad$
b) The acid content of the book was found to be 0.032 moles of $\mathrm{H}^{+}{ }_{(\mathrm{aq})}$. The equation for the reaction between zinc oxide and acid is:

$$
\mathrm{ZnO}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq}) \rightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

i) Calculate the mass of zinc oxide required to neutralise the acid in the book.
$\qquad$
ii) Hence calculate the mass of excess zinc oxide which remains in the book.
$\qquad$
$\qquad$

## 7 - SOLUTION CALCULATIONS

## Normal solution calculations

a) Use the volume and concentration of one reactant to calculate the moles.
b) Use the chemical equation to find the moles of the other reactant.

```
concentration (mol/dm}\mp@subsup{}{}{3})=\underline{moles
    volume (dm}\mp@subsup{}{}{3}
```

c) Calculate the volume or concentration as required of that reactant.

## Note

- Volume in $\mathrm{dm}^{3}=\frac{\text { volume in } \mathrm{cm}^{3}}{1000}$
- In many titrations, a standard solution of one the reagents is made (typically $250 \mathrm{~cm}^{3}$ in a volumetric flask), and $25 \mathrm{~cm}^{3}$ portions of this standard solution are used in each titration
- Monoprotic acids contain one $\mathrm{H}^{+}$ion per unit (e.g. $\mathrm{HCl}, \mathrm{HNO}_{3}, \mathrm{CH}_{3} \mathrm{COOH}$ ) - with NaOH they react in the ratio 1:1 (acid : NaOH )
- Diprotic acids contain two $\mathrm{H}^{+}$ions per unit (e.g. $\mathrm{H}_{2} \mathrm{SO}_{4}$ ) - with NaOH they react in the ratio 1:2 (acid : NaOH )
- Triprotic acids contain three $\mathrm{H}^{+}$ions per unit (e.g. $\left.\mathrm{H}_{3} \mathrm{PO}_{4}\right)$ - with NaOH they react in the ratio $1: 3($ acid : NaOH$)$
E.g. 1: $\quad 25.0 \mathrm{~cm}^{3}$ of $0.020 \mathrm{~mol} / \mathrm{dm}^{3}$ sulphuric acid neutralises $18.6 \mathrm{~cm}^{3}$ of sodium hydroxide solution.

$$
\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

a) Find the concentration of the sodium hydroxide solution in $\mathrm{mol} / \mathrm{dm}^{3}$.

$$
\begin{aligned}
& \text { Moles of } \mathrm{H}_{2} \mathrm{SO}_{4}=\text { conc } \times \mathrm{vol}\left(\mathrm{dm}^{3}\right)=0.020 \mathrm{x}^{25} / 1000=0.000500 \\
& \text { Moles of } \mathrm{NaOH}=\text { conc } \times \mathrm{vol}\left(\mathrm{dm}^{3}\right)=2 \times \text { moles } \mathrm{H}_{2} \mathrm{SO}_{4}=0.000500 \times 2=0.00100 \\
& \text { Concentration of } \mathrm{NaOH}=\frac{\mathrm{mol}}{\operatorname{vol}\left(\mathrm{dm}^{3}\right)}=\frac{0.00100}{\left({ }^{(8.6 / 1000)}\right)}=\underline{\mathbf{0 . 0 5 3 8} \mathrm{mol} / \mathrm{dm}^{3}}
\end{aligned}
$$

b) Find the concentration of the sodium hydroxide solution in $\mathrm{g} / \mathrm{dm}^{3}$.

```
Mr of NaOH = 23.0 + 16.0 + 1.0 = 40.0
Mass of NaOH in 1 dm}\mp@subsup{}{}{3}=\mp@subsup{M}{r}{}\times\mathrm{ moles = 40.0 x 0.0538=2.15 g
Concentration = 2.15 g/dm
```

E.g. 2: Crystals of citric acid contain water of crystallisation $\left(\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7} . \mathrm{nH}_{2} \mathrm{O}\right)$. Citric acid is a triprotic acid. 1.52 g of the citric acid was made up to $250 \mathrm{~cm}^{3}$ solution. $25 \mathrm{~cm}^{3}$ portions of this solution required $21.80 \mathrm{~cm}^{3}$ of $0.100 \mathrm{~mol} \mathrm{dm}^{-3}$ for neutralisation. Calculate the value of $n$.
Moles of $\mathrm{NaOH}=$ conc $\mathrm{xvol}\left(\mathrm{dm}^{3}\right)=0.100 \mathrm{x}^{21.70 / 1000=0.00218}$
Moles of $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7} . \mathrm{nH}_{2} \mathrm{O}$ in each titration $=0.00218 / 3=0.000727$ ( 1 mol of acid reacts with 3 mol of NaOH )
Moles of $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7} \cdot \mathrm{nH}_{2} \mathrm{O}$ in $250 \mathrm{~cm}^{3}$ solution $=0.000727 \times 10=0.00727$
$\mathrm{M}_{\mathrm{r}}$ of $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7} \cdot \mathrm{nH}_{2} \mathrm{O}=\frac{\text { mass }}{\text { moles }}=\frac{1.52}{0.00727}=209.2$
$\mathrm{M}_{\mathrm{r}}$ of $\mathrm{nH}_{2} \mathrm{O}=209.2-192.1=17.1$
$\mathrm{n}=\frac{17.1}{18.0}=0.950=1$ ( n is a whole number)

## TASK 16 - SOLUTION CALCULATIONS

1) Calculate the number of moles in the following.
a) $2 \mathrm{dm}^{3}$ of $0.05 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{HCl}$
b) 50 litres of $5 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{H}_{2} \mathrm{SO}_{4}$
c) $10 \mathrm{~cm}^{3}$ of $0.25 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{KOH}$
2) Calculate the concentration of the following in both $\mathrm{mol} \mathrm{dm}^{-3}$ and $\mathrm{g} \mathrm{dm}^{-3}$
a) 0.400 moles of HCl in 2.00 litres of solution
b) 12.5 moles of $\mathrm{H}_{2} \mathrm{SO}_{4}$ in $5.00 \mathrm{dm}^{3}$ of solution
c) 1.05 g of NaOH in $500 \mathrm{~cm}^{3}$ of solution
3) Calculate the volume of each solution that contains the following number of moles.
a) 0.00500 moles of NaOH from $0.100 \mathrm{~mol} \mathrm{dm}^{-3}$ solution
b) $1.00 \times 10^{-5}$ moles of HCl from $0.0100 \mathrm{~mol} \mathrm{dm}^{-3}$ solution
4) $\quad 25.0 \mathrm{~cm}^{3}$ of $0.020 \mathrm{~mol} \mathrm{dm}^{-3}$ sulphuric acid neutralises $18.6 \mathrm{~cm}^{3}$ of barium hydroxide solution.

$$
\mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{Ba}(\mathrm{OH})_{2} \rightarrow \mathrm{BaSO}_{4}+2 \mathrm{H}_{2} \mathrm{O}
$$

a) Find the concentration of the barium hydroxide solution in $\mathrm{mol} \mathrm{dm}^{-3}$.
b) Find the concentration of the barium hydroxide solution in $\mathrm{g} \mathrm{dm}^{-3}$.
5) $\quad 25.0 \mathrm{~cm}^{3}$ of a solution of sodium hydroxide required $18.8 \mathrm{~cm}^{3}$ of $0.0500 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{H}_{2} \mathrm{SO}_{4}$.

$$
\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O}
$$

a) Find the concentration of the sodium hydroxide solution in $\mathrm{mol} \mathrm{dm}^{-3}$.
b) Find the concentration of the sodium hydroxide solution in $\mathrm{g} \mathrm{dm}^{-3}$.
6) Calculate the volume of $0.05 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{KOH}$ is required to neutralise $25.0 \mathrm{~cm}^{3}$ of $0.0150 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{HNO}_{3}$.

$$
\mathrm{HNO}_{3}+\mathrm{KOH} \rightarrow \mathrm{KNO}_{3}+\mathrm{H}_{2} \mathrm{O}
$$

7) $25.0 \mathrm{~cm}^{3}$ of arsenic acid, $\mathrm{H}_{3} \mathrm{AsO}_{4}$, required $37.5 \mathrm{~cm}^{3}$ of $0.100 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium hydroxide for neutralisation.

$$
3 \mathrm{NaOH}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{AsO}_{4}(\mathrm{aq}) \rightarrow \mathrm{Na}_{3} \mathrm{AsO}_{4}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})
$$

a) Find the concentration of the acid in $\mathrm{mol} \mathrm{dm}^{-3}$.
b) Find the concentration of the acid in $\mathrm{g} \mathrm{dm}^{-3}$.
8) A $250 \mathrm{~cm}^{3}$ solution of NaOH was prepared. $25.0 \mathrm{~cm}^{3}$ of this solution required $28.2 \mathrm{~cm}^{3}$ of $0.100 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{HCl}$ for neutralisation. Calculate what mass of NaOH was dissolved to make up the original $250 \mathrm{~cm}^{3}$ solution.

$$
\mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}
$$

9) What volume of $5.00 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{HCl}$ is required to neutralise 20.0 kg of $\mathrm{CaCO}_{3}$ ?

$$
2 \mathrm{HCl}+\mathrm{CaCO}_{3} \rightarrow \mathrm{CaCl}_{2}+\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}
$$

10) 3.88 g of a monoprotic acid was dissolved in water and the solution made up to $250 \mathrm{~cm}^{3} .25 .0 \mathrm{~cm}^{3}$ of this solution was titrated with $0.095 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{NaOH}$ solution, requiring $46.5 \mathrm{~cm}^{3}$. Calculate the relative molecular mass of the acid.
11) A 1.575 g sample of ethanedioic acid crystals, $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} \cdot \mathrm{nH}_{2} \mathrm{O}$, was dissolved in water and made up to $250 \mathrm{~cm}^{3}$. One mole of the acid reacts with two moles of NaOH . In a titration, $25.0 \mathrm{~cm}^{3}$ of this solution of acid reacted with exactly $15.6 \mathrm{~cm}^{3}$ of $0.160 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{NaOH}$. Calculate the value of n .
12) A solution of a metal carbonate, $\mathrm{M}_{2} \mathrm{CO}_{3}$, was prepared by dissolving 7.46 g of the anhydrous solid in water to give $1000 \mathrm{~cm}^{3}$ of solution. $25.0 \mathrm{~cm}^{3}$ of this solution reacted with $27.0 \mathrm{~cm}^{3}$ of $0.100 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid. Calculate the relative formula mass of $\mathrm{M}_{2} \mathrm{CO}_{3}$ and hence the relative atomic mass of the metal M .
13) An impure sample of barium hydroxide of mass 1.6524 g was allowed to react with $100 \mathrm{~cm}^{3}$ of $0.200 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid. When the excess acid was titrated against sodium hydroxide, $10.9 \mathrm{~cm}^{3}$ of sodium hydroxide solution was required. $25.0 \mathrm{~cm}^{3}$ of the sodium hydroxide required $28.5 \mathrm{~cm}^{3}$ of the hydrochloric acid in a separate titration. Calculate the percentage purity of the sample of barium hydroxide.

## 2) Back titrations

A back titration is done to analyse a base (or acid) that does not react easily or quickly with an acid (or base). Instead, the base (or acid) is treated with an excess of acid (or base), and then the left over acid (or base) titrated. You can then work back to find out about the original base (or acid).
e.g. Imagine that we are trying to find out how many moles of $\mathrm{CaCO}_{3}$ we have (let's call it x moles). We add 10 moles of HCl (an excess). The excess is made into a $250 \mathrm{~cm}^{3}$ stock solution and then $25 \mathrm{~cm}^{3}$ portions of it require 0.4 moles of NaOH for neutralisation.

$$
\mathrm{CaCO}_{3}+2 \mathrm{HCl} \rightarrow \mathrm{CaCl}_{2}+\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2} \quad \mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}
$$

- This means that there is $10 \times 0.4$ moles ( $=4$ moles) of left over HCl in the stock solution
- This means that 6 moles ( $10-4$ moles) of HCl reacted with the $\mathrm{CaCO}_{3}$.
- This means that there must have been 3 moles of $\mathrm{CaCO}_{3}$ (i.e. $x=3$ ) in the first place (remember that 2 moles of HCl reacts with each mole of $\mathrm{CaCO}_{3}$ ).
e.g. Aspirin is a monoprotic acid that can be analysed by a back titration with NaOH . We add 0.25 moles of NaOH (an excess) to y moles of aspirin and make the resulting solution into a $250 \mathrm{~cm}^{3}$ stock solution. We titrate $25 \mathrm{~cm}^{3}$ portions of the solution which require 0.01 moles of HCl for neutralisation. Calculate the original moles of aspirin.
e.g. Malachite is an ore containing copper carbonate $\left(\mathrm{CuCO}_{3}\right.$. We add 5.00 moles of HCl (an excess) to some crushed malachite and make the resulting solution into a $250 \mathrm{~cm}^{3}$ stock solution. We titrate $25 \mathrm{~cm}^{3}$ portions of the solution which require 0.15 moles of NaOH for neutralisation. Calculate the original moles of copper carbonate in the malachite.

## TASK 17 - BACK TITRATION CALCULATIONS

1) Limestone is mainly calcium carbonate. A student wanted to find what percentage of some limestone was calcium carbonate. A 1.00 g sample of limestone is allowed to react with $100 \mathrm{~cm}^{3}$ of $0.200 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{HCl}$. The excess acid required $24.8 \mathrm{~cm}^{3}$ of $0.100 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{NaOH}$ solution in a back titration. Calculate the percentage of calcium carbonate in the limestone.

$$
\mathrm{CaCO}_{3}+2 \mathrm{HCl} \rightarrow \mathrm{CaCl}_{2}+\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2} \quad \mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}
$$

2) An impure sample of barium hydroxide of mass 1.6524 g was allowed to react with $100 \mathrm{~cm}^{3}$ of $0.200 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid. When the excess acid was titrated against $0.228 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium hydroxide in a back titration, $10.9 \mathrm{~cm}^{3}$ of sodium hydroxide solution was required. Calculate the percentage purity of the sample of barium hydroxide.

$$
\mathrm{Ba}(\mathrm{OH})_{2}+2 \mathrm{HCl} \rightarrow \mathrm{BaCl}_{2}+2 \mathrm{H}_{2} \mathrm{O} \quad \mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}
$$

3) Calculate (a) the moles and (b) the mass of magnesium carbonate at the start if 0.2 moles of sulfuric acid is added to the magnesium carbonate and the excess sulfuric acid made up to a $250 \mathrm{~cm}^{3}$ solution. $25 \mathrm{~cm}^{3}$ of this solution required 0.03 moles of sodium hydroxide for neutralisation.

$$
\mathrm{MgCO}_{3}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{MgSO}_{4}+\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2} \quad \mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}
$$

4) A student wanted to find the mass of calcium carbonate in an indigestion tablet. She crushed up a tablet and added an excess of hydrochloric acid $\left(25.0 \mathrm{~cm}^{3}\right.$ of $\left.1.00 \mathrm{~mol} \mathrm{dm}^{-3}\right)$. She then titrated the excess against $0.50 \mathrm{~mol} \mathrm{dm}^{-3}$ NaOH requiring $25.8 \mathrm{~cm}^{3}$ of the NaOH . Calculate the mass of calcium carbonate in the tablet.
5) A sample containing ammonium chloride was warmed with $100 \mathrm{~cm}^{3}$ of $1.00 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium hydroxide solution. After the ammonia had reacted the excess sodium hydroxide required $50.0 \mathrm{~cm}^{3}$ of $0.250 \mathrm{~mol} \mathrm{dm}{ }^{-3} \mathrm{HCl}$ for neutralisation. What mass of ammonium chloride did the sample contain?

6) A fertiliser contains ammonium sulphate and potassium sulphate. A sample of 1.455 g of the fertiliser was warmed with $25 \mathrm{~cm}^{3} 0.2 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium hydroxide solution giving off ammonia gas. The remaining NaOH that was not used required $28.7 \mathrm{~cm}^{3}$ of $0.100 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid for neutralisation. Calculate the percentage by mass of ammonium sulphate in the sample.
7) Silicon tetrachloride dissolves in ethoxyethane, an inert solvent. If the ethoxyethane is contaminated with a little water, a partial hydrolysis occurs and two compounds $\mathbf{A}$ and $\mathbf{B}$ are formed. The formula of $\mathbf{A}$ is $\mathrm{Si}_{2} \mathrm{OCl}_{6}$ and that of B is $\mathrm{Si}_{3} \mathrm{O}_{2} \mathrm{Cl}_{8}$.

When a 0.100 g sample of one of the compounds, $\mathbf{A}$ or $\mathbf{B}$ reacted with an excess of water, all the chlorine present was converted to chloride ions. Titration of this solution with aqueous silver nitrate, in the presence of a suitable indicator, required $42.10 \mathrm{~cm}^{3}$ of $0.0500 \mathrm{~mol} \mathrm{dm}^{-3}$ aqueous silver nitrate for complete precipitation of silver chloride. Deduce which of the compounds $\mathbf{A}$ or $\mathbf{B}$ was present in the 0.100 g sample.

## 8 - EMPIRICAL \& MOLECULAR FORMULAS

- Every substance has an empirical formula. It shows the simplest ratio of atoms of each element in a substance.
e.g. $\quad \mathrm{SiO}_{2}$ (giant covalent) - the ratio of $\mathrm{Si}: \mathrm{O}$ atoms in the lattice is 1:2
$\mathrm{Al}_{2} \mathrm{O}_{3}$ (ionic) - the ratio of $\mathrm{Al}^{3+}: \mathrm{O}^{2-}$ ions in the lattice is $2: 3$
$\mathrm{H}_{2} \mathrm{O}$ (molecular) - the ratio of $\mathrm{H}: \mathrm{O}$ atoms in the substance is $1: 2$
- Substances made of molecules also have a molecular formula. This indicates the number of atoms of each element in one molecule.

## a) Finding the molecular formula from the formula mass and empirical formula

e.g. $\quad$ Empirical formula $=\mathrm{CH}_{2}, \mathrm{M}_{\mathrm{r}}=42.0$

Formula mass of empirical formula $=14.0 \therefore \mathrm{M}_{\mathrm{r}} /$ formula mass of empirical formula $=42.0 / 14.0=3$
Molecular formula $=3 x$ empirical formula $=\mathrm{C}_{3} \mathrm{H}_{6}$

## b) Finding the empirical formula of a compound from its composition by percentage or mass

i) Write out the mass or percentage of each element,
ii) Divide each mass or percentage by the $\mathrm{A}_{\mathrm{r}}$ of the element (not the $\mathbf{M}_{\mathbf{r}}$ )
iii) Find the simplest whole number ratio of these numbers by dividing by the smallest number. If the values come out as near $1 / 2$ 's then times them by 2 , if they are near $1 / 3^{\prime}$ 's then times by 3 .
e.g. i) A compound is found to contain, by mass, iron $72.4 \%$ and oxygen $27.6 \%$.

Fe $\frac{72.4}{56}=1.29 \quad O \frac{27.6}{16}=1.73$
Simplest ratio $\mathrm{Fe}: \mathrm{O}=1.29: 1.73 \quad$ (divide by smallest, i.e. 1.29)
1:1.34 (involves $\frac{1}{3}$ 's so $\times 3$ )
3:4
$\therefore$ empirical formula $=\mathrm{Fe}_{3} \mathrm{O}_{4}$
e.g. ii) 0.25 g of hydrogen reacts with oxygen to produce 4.25 g of hydrogen peroxide $\left(\mathrm{M}_{\mathrm{r}}=34.0\right)$.

Mass of oxygen reacting with hydrogen $=4.25-0.25=4.00 \mathrm{~g}$
H $\frac{0.25}{1}=0.25 \quad$ O $\frac{4.00}{16}=0.25$
Simplest ratio $\mathrm{H}: \mathrm{O}=0.25: 0.25 \quad$ (divide by smallest, i.e. 0.25 )
1:1
$\therefore$ empirical formula $=\mathbf{H O}$
Formula mass of empirical formula $=17.0$
$\therefore \mathrm{M}_{\mathrm{r}} /$ formula mass of empirical formula $=34.0 / 17.0=2$
Molecular formula $=2 x$ empirical formula $=\mathbf{H}_{2} \mathbf{O}_{\mathbf{2}}$

## TASK 18 - EMPRICIAL \& MOLECULAR FORMULAS

1) Write the empirical formula of each of the following substances.
a) $\mathrm{C}_{2} \mathrm{H}_{6}$
b) $\mathrm{P}_{2} \mathrm{O}_{3}$
c) $\mathrm{SO}_{2}$
d) $\mathrm{C}_{6} \mathrm{H}_{12}$
e) $\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}_{2}$
f) $\mathrm{C}_{2} \mathrm{H}_{7} \mathrm{~N}$
g) $\mathrm{B}_{6} \mathrm{H}_{10}$
h) $\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}$
2) The empirical formula and relative molecular mass of some simple molecular compounds are shown below. Work out the molecular formula of each one.
a) $\mathrm{NH}_{2}$
$M_{r}=32$
d) $\mathrm{PH}_{3}$
$M_{r}=34$
b) $\mathrm{C}_{2} \mathrm{H}_{5}$
$M_{r}=58$
e) CH
$M_{r}=78$
c) $\mathrm{CH}_{2}$
$M_{r}=70$
f) $\mathrm{CH}_{2}$
$M_{r}=42$
3) Find the simplest whole number ratio for each of the following. The numbers come from experiments so there will be some small random errors which mean that you can round the numbers a little bit.
a) $1.5: 1$
b) $1: 1.98$
c) $4.97: 1$
d) $1: 2.52$
e) $1: 1.33$
f) $1.66: 1$
g) $1: 1.26$
h) $1: 1.74$
4) Find the empirical formulae of the following compounds using the data given.
a) $\mathrm{Ca} 20 \%$

Br 80 \%
b) $\quad \mathrm{Na} 29.1 \%$

S $40.5 \%$
O 30.4 \%
c) $\mathrm{C} \quad 53.3 \%$

H 15.5 \%
N $31.1 \%$
d) $\quad$ C 2.73 g

O 7.27 g
e) $N \quad 15.2 \mathrm{~g}$

O 34.8 g
5) 3.53 g of iron reacts with chlorine to form 10.24 g of iron chloride. Find the empirical formula of the iron chloride.
6) 50.0 g of a compound contains 22.4 g of potassium, 9.2 g of sulphur, and the rest oxygen. Calculate the empirical formula of the compound.
7) An oxide of phosphorus contains 56.4 \% phosphorus and 43.6 \% oxygen. Its relative molecular mass is 220 . Find both the empirical and the molecular formula of the oxide.
8) A compound contains 40.0 g of carbon, 6.7 g of hydrogen and 53.5 g of oxygen. It has a relative molecular formula of 60. Find both the empirical and the molecular formula of the compound.
9) An organic compound $X$, which contains carbon, hydrogen and oxygen only, has an $M_{r}$ of 85 . When 0.43 g of X are burned in excess oxygen, 1.10 g of carbon dioxide and 0.45 g of water are formed. Find the empirical and molecular formulae of compound X .
10) When ammonium dichromate $(\mathrm{VI})$ is added gradually to molten ammonium thiocyanate, Reinecke's salt is formed. It has the formula $\mathrm{NH}_{4}\left[\mathrm{Cr}(\mathrm{SCN})_{\mathrm{x}}\left(\mathrm{NH}_{3}\right)_{y}\right]$ and the following composition by mass: $\mathrm{Cr}=15.5 \%, \mathrm{~S}=38.15 \%, \mathrm{~N}=29.2 \%$. Calculate the values of $x$ and $y$ in the above formula.

1) A compound contains $59.4 \%$ carbon, $10.9 \%$ hydrogen, $13.9 \%$ nitrogen and $15.8 \%$ oxygen, by mass. Find the empirical formula of the compound.
2) A compound containing carbon, hydrogen and oxygen only contains $74.2 \%$ carbon and $7.9 \%$ hydrogen. Its $\mathrm{M}_{\mathrm{r}}$ is found to be 178 by mass spectroscopy. Find its empirical and molecular formulae.
3) What mass of carbon monoxide is needed to react with 1.00 kg of iron oxide?

$$
\mathrm{Fe}_{2} \mathrm{O}_{3}+3 \mathrm{CO} \rightarrow 2 \mathrm{Fe}+3 \mathrm{CO}_{2}
$$

4) The reaction below is known as the Thermitt reaction, which is used to form molten iron to mould train tracks together. What mass of aluminium powder is needed to react with 8.00 g of iron (III) oxide?

$$
2 \mathrm{Al}+\mathrm{Fe}_{2} \mathrm{O}_{3} \rightarrow \mathrm{Al}_{2} \mathrm{O}_{3}+2 \mathrm{Fe}
$$

5) What volume of $0.100 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid would react with 25.0 g of calcium carbonate?

$$
\mathrm{CaCO}_{3}+2 \mathrm{HCl} \rightarrow \mathrm{CaCl}_{2}+\mathrm{CO}_{2}+\mathrm{H}_{2}
$$

6) $25.0 \mathrm{~cm}^{3}$ of $0.0400 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium hydroxide solution reacted with $20.75 \mathrm{~cm}^{3}$ of sulphuric acid in a titration. Find the concentration of the sulphuric acid.
7) $\quad 13.8 \mathrm{~g}$ of a solid monoprotic acid was dissolved in water and made up to $250 \mathrm{~cm}^{3} .25 .0 \mathrm{~cm}^{3}$ portions of this were titrated against $0.250 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium hydroxide, requiring $23.5 \mathrm{~cm}^{3}$. Calculate the $\mathrm{M}_{\mathrm{r}}$ of the acid.
8) 10.0 g of a mixture of copper powder and magnesium powder was mixed with $100 \mathrm{~cm}^{3}$ of $1.00 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid. The copper does not react, but the magnesium does as shown:

$$
\mathrm{Mg}+2 \mathrm{HCl} \rightarrow \mathrm{MgCl}_{2}+\mathrm{H}_{2}
$$

The resulting solution was filtered to remove unreacted copper and then made up to $250 \mathrm{~cm}^{3}$ with water. $25.0 \mathrm{~cm}^{3}$ of this solution was found to neutralise $36.8 \mathrm{~cm}^{3}$ of $0.200 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{NaOH}$. Find the $\%$ by mass of the magnesium in the metal powder mixture.
9) 12.0 g of a mixture of calcium carbonate and sodium chloride was treated with $100 \mathrm{~cm}^{3}$ of $2.00 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid (only the calcium carbonate reacts). The resulting solution was made up to $250 \mathrm{~cm}^{3}$ with water and a $25.0 \mathrm{~cm}^{3}$ portion of this needed $34.1 \mathrm{~cm}^{3}$ of $0.200 \mathrm{~mol} \mathrm{dm}^{-3}$ sodium hydroxide for neutralisation. Find the $\%$ by mass of the calcium carbonate in the mixture.
10) The solid booster rockets of the space shuttle are fuelled by a mixture of aluminium and ammonium chlorate (VII) $\left(\mathrm{NH}_{4} \mathrm{ClO}_{4}\right)$.
a) If no other reagents are involved, and the products are nitrogen, water, hydrogen chloride and aluminium oxide, devise an equation for this reaction.
b) Each launch consumes about 160 tonnes of aluminium. What mass of hydrogen chloride gas is produced in the atmosphere above the Cape Canaveral launch pad?

Full worked solutions are available to subscribers of www.chemsheets.co.uk.

```

## TASK 5 - Writing balanced equations 2

```
\(14 \mathrm{Al}+3 \mathrm{O}_{2} \rightarrow 2 \mathrm{Al}_{2} \mathrm{O}_{3}\)
\(2 \mathrm{C}_{6} \mathrm{H}_{14}+91 / 2 \mathrm{O}_{2} \rightarrow 6 \mathrm{CO}_{2}+7 \mathrm{H}_{2} \mathrm{O}\) or \(2 \mathrm{C}_{6} \mathrm{H}_{14}+19 \mathrm{O}_{2} \rightarrow 12 \mathrm{CO}_{2}+14 \mathrm{H}_{2} \mathrm{O}\)
\(3 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{SH}+41 / 2 \mathrm{O}_{2} \rightarrow 2 \mathrm{CO}_{2}+\mathrm{SO}_{2}+3 \mathrm{H}_{2} \mathrm{O}\) or \(2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{SH}+9 \mathrm{O}_{2} \rightarrow 4 \mathrm{CO}_{2}+2 \mathrm{SO}_{2}+6 \mathrm{H}_{2} \mathrm{O}\)
\(42 \mathrm{Li}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{LiOH}+\mathrm{H}_{2}\)
\(5 \quad \mathrm{CaCO}_{3}+2 \mathrm{HNO}_{3} \rightarrow \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}+\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}\)
\(6 \quad \mathrm{Li}_{2} \mathrm{CO}_{3} \rightarrow \mathrm{Li}_{2} \mathrm{O}+\mathrm{CO}_{2}\)
```

$7 \quad \mathrm{NH}_{3}+\mathrm{HNO}_{3} \rightarrow \mathrm{NH}_{4} \mathrm{NO}_{3}$
$8 \mathrm{~K}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{~K}_{2} \mathrm{SO}_{4}+\mathrm{H}_{2} \mathrm{O}$
$9 \mathrm{Ca}(\mathrm{OH})_{2}+2 \mathrm{HCl} \rightarrow \mathrm{CaCl}_{2}+2 \mathrm{H}_{2} \mathrm{O}$
$103 \mathrm{Zn}+2 \mathrm{H}_{3} \mathrm{PO}_{4} \rightarrow \mathrm{Zn}_{3}\left(\mathrm{PO}_{4}\right)_{2}+3 \mathrm{H}_{2}$
$112 \mathrm{NaHCO}_{3}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}$
$122 \mathrm{KOH}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{~K}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O}$

## TASK 6 - Ionic equations

$1 \mathrm{HCl}, \mathrm{LiOH}, 1: 1 ; \mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{NaHCO}_{3}, 1: 2 ; \mathrm{HNO}_{3}, \mathrm{NH}_{3}, 1: 1 ; \mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{~K}_{2} \mathrm{CO}_{3}, 1: 1, \mathrm{HNO}_{3}, \mathrm{Sr}(\mathrm{OH})_{2}, 2: 1$
2 a $\mathrm{H}^{+}+\mathrm{OH}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}$
b $\mathrm{Ag}^{+}+\mathrm{I}^{-} \rightarrow \mathrm{AgI}$
c $2 \mathrm{H}^{+}+\mathrm{CO}_{3}{ }^{2-} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}$
d $\mathrm{Ca}^{2+}+2 \mathrm{OH}^{-} \rightarrow \mathrm{Ca}(\mathrm{OH})_{2}$
e $\mathrm{NH}_{3}+\mathrm{H}^{+} \rightarrow \mathrm{NH}_{4}^{+}$
f $\mathrm{H}^{+}+\mathrm{HCO}_{3}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}$
g $\mathrm{Ca}^{2+}+\mathrm{SO}_{4}{ }^{2-} \rightarrow \mathrm{CaSO}_{4}$
h $\mathrm{Pb}^{2+}+2 \mathrm{Cl}^{-} \rightarrow \mathrm{PbCl}_{2}$
i $\mathrm{H}^{+}+\mathrm{OH}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}$

## TASK 7 - Significant figures \& standard form

| 1 | a | 345800 | b | 297000 | c | 0.0790 | d | 6.00 | e | 0.00156 | f | 0.01000 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | a | 2350000 | b | 0.250 | c | 13.7 | d | 30.0 | e | 0.00198 | f | 0.000313 |
| 3 | a | 0.0015 | b | 0.00046 | c | 357500 | d | 534 | e | 1030000 | f | 0.00835 |
| 4 | a | $1.64 \times 10^{-4}$ | b | $5.24 \times 10^{-2}$ | c | $1.5 \times 10^{-8}$ | d | $3.45 \times 10^{4}$ | e | $6.2 \times 10^{-1}$ | f | $8.7 \times 10^{7}$ |
| 5 | a | 0.0214 | b | $6.14 \times 10^{-5}$ | c | $4.00 \times 10^{8}$ | d | 2400 | e | 0.0610 | f | $8.00 \times 10^{-7}$ |

## TASK 8 - Moles

| 1 | a | 2.96 | b | 50.3 | c | 0.500 | d | 17100 | e |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | a | 355 g | b | 20.4 g | c | 1.08 g | d | 0.264 g | e |
| 3 | a | 0.25 | b | 0.25 | c | 0.50 | 0.8 g |  |  |
| 4 | a | 0.050 | b | 0.10 | c | 0.15 |  |  |  |
| 5 | 176 |  |  |  |  |  |  |  |  |
| 6 | a $1.670 \times 10^{-24} \mathrm{~g}$ | b $1.673 \times 10^{-24} \mathrm{~g}$ | c $5.023 \times 10^{-24} \mathrm{~g}$ |  |  |  |  |  |  |

## TASK 9 - What equations mean

$1 \quad 12 \mathrm{~mol} \mathrm{Na}+3 \mathrm{~mol} \mathrm{O}_{2} \rightarrow 6 \mathrm{~mol} \mathrm{Na}_{2} \mathrm{O} ; \quad 0.1 \mathrm{~mol} \mathrm{Na}+0.025 \mathrm{~mol} \mathrm{O}_{2} \rightarrow 0.05 \mathrm{~mol} \mathrm{Na}_{2} \mathrm{O}$
$25 \mathrm{~mol} \mathrm{Al}+7.5 \mathrm{~mol} \mathrm{Cl}_{2} \rightarrow 5 \mathrm{~mol} \mathrm{AlCl}_{3} ; \quad 0.1 \mathrm{~mol} \mathrm{Al}+0.15 \mathrm{~mol} \mathrm{Cl}_{2} \rightarrow 0.1 \mathrm{~mol} \mathrm{AlCl}_{3}$
$30.5 \mathrm{~mol} \mathrm{C}_{4} \mathrm{H}_{10}+3.25 \mathrm{~mol} \mathrm{O}_{2} \rightarrow 2 \mathrm{~mol} \mathrm{CO}_{2}+2.5 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O} ; 20 \mathrm{~mol} \mathrm{C}_{4} \mathrm{H}_{10}+130 \mathrm{~mol} \mathrm{O}_{2} \rightarrow 80 \mathrm{~mol} \mathrm{CO}_{2}+100 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}$
$40.5 \mathrm{~mol} \mathrm{NH}_{3}+0.375 \mathrm{~mol} \mathrm{O}_{2} \rightarrow 0.25 \mathrm{~mol} \mathrm{~N}_{2}+0.75 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O} ; 10 \mathrm{~mol} \mathrm{NH}_{3}+7.5 \mathrm{~mol} \mathrm{O}_{2} \rightarrow 5 \mathrm{~mol} \mathrm{~N}_{2}+15 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}$

## TASK 10 - Reacting mass calculations 1

| 1 | 1.01 g | 2 | 126 g | 3 | 120 g | 4 | 253000 g | 5 | 17.6 g | 6 | 12.0 g |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | 7 | 8 | 6 | 9 | 9780 g | 10 | 1562000 g | 11 | 0.00940 g | 12 | 1.11 g |
| 13 | 115 g | 14 | 1650000 g | 15 | 64.0 g | 16 | 89.3 g |  |  |  |  |

## TASK 11 - Reacting mass calculations 2

| 1 | a $2 \mathrm{~mol} \mathrm{NH}_{3}$ | b | $6 \mathrm{~mol} \mathrm{NH}_{3}$ | c | $1.33 \mathrm{~mol} \mathrm{NH}_{3}$ | d | $1.0 \mathrm{~mol} \mathrm{NH}_{3}$ | e | $4 \mathrm{~mol} \mathrm{NH}_{3}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | a $3 \mathrm{~mol} \mathrm{SO}_{3}$ | b | $3 \mathrm{~mol} \mathrm{SO}_{3}$ | c | $0.04 \mathrm{~mol} \mathrm{SO}_{3}$ | d | $0.8 \mathrm{~mol} \mathrm{SO}_{3}$ | e | $2 \mathrm{~mol} \mathrm{SO}_{3}$ |
| 3 | 7.88 g | 4 | 2694 g | 5 | 303000 g | 6 | 98.6 g | 7 | 1210 g |

## CHALLENGE 1

$1 \quad \mathrm{NaHCO}_{3}=3.51 \mathrm{~g}, \mathrm{Na}_{2} \mathrm{CO}_{3} 6.49 \mathrm{~g} \quad 2 \quad \mathrm{CaCO}_{3}=40.3 \%, \mathrm{MgCO}_{3}=59.7 \% \quad 3 \quad \mathrm{C}_{4} \mathrm{H}_{8} \quad 4 \quad 26.6 \%$

## TASK 12 - Percentage yield

| 1 | a | 120 g | b | $74.9 \%$ | c | reversible, product lost on isolation, other reactions take place |  |  |
| :--- | :--- | :--- | :--- | :--- | :---: | :--- | :--- | :--- |
| 2 | a | 700000 g | b | $92.3 \%$ |  | 3 | a | 510 g |
| 4 | a | 25.2 g | b | $79.4 \%$ | 5 | a | 529 g | b |
| 6 | a | 330 g | b | $90.8 \%$ | 7 | a | 2.40 g | b |

## TASK 13 - Atom economy

| 1 | $39.3 \%$ | 2 | $1.5 \%$ | 3 | $45.8 \%$ | 4 | $56.0 \%$ | 5 | $100 \%$ | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

d \% yield compares the amount produced compared to the amount you should get, atom economy is the proportion of the mass of all the products that is the desired product

## TASK 14 - Ideal gas equation

| 1 | a | 473 K | b | 98000 Pa | c | $50 \times 10^{-6} \mathrm{~m}^{3}$ | d | 223 K | e | 100000 Pa | f | $3.2 \times 10^{-3} \mathrm{~m}^{3}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | $1.24 \times 10^{-3} \mathrm{~m}^{3}$ | 3 | 0.786 | 4 | 104000 Pa | 5 | 155 K | 6 | 71.0 | 7 | $0.00380 \mathrm{~m}^{3}$ |  |
| 8 | 3.36 g | 9 | $0.000538 \mathrm{~m}^{3}$ | 10 | $4.53 \mathrm{~m}^{3}$ | 11 | 64.1 | 12 | 483 K | 13 | 126400 Pa |  |

## TASK 15 - Reacting gas volumes

| 1 | a | $\mathrm{O}_{2} 2 \mathrm{dm}^{3}, \mathrm{CO}_{2} 1 \mathrm{dm}^{3}$ | b | $\mathrm{O}_{2} 120 \mathrm{~cm}^{3}, \mathrm{CO}_{2} 80 \mathrm{~cm}^{3}$ |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | c | $\mathrm{O}_{2} 1250 \mathrm{~cm}^{3}, \mathrm{CO}_{2} 1000 \mathrm{~cm}^{3}$ | d | $\mathrm{O}_{2} 5625 \mathrm{~cm}^{3}, \mathrm{CO}_{2} 4500 \mathrm{~cm}^{3} \mathrm{q}$ | 2 | $20 \mathrm{~cm}^{3} \mathrm{HBr}$ left at end |
| 3 | $300 \mathrm{~cm}^{3} \mathrm{O}_{2}, 100 \mathrm{~cm}^{3} \mathrm{CO}_{2}$, total $400 \mathrm{~cm}^{3}$ gas at end | 4 | $4 \mathrm{dm}^{3} \mathrm{O}_{2}, 4 \mathrm{dm}^{3} \mathrm{H}_{2} \mathrm{O}, 4 \mathrm{dm}^{3} \mathrm{SO}_{2}$, total $12 \mathrm{dm}^{3}$ gas |  |  |  |

## CHALLENGE 2

$1 \quad 44.021: 3.11,40.9 \mathrm{~g}$
3 NS
$4 \quad \mathrm{C}_{2} \mathrm{H}_{4} 5 \quad 515 \mathrm{~ms}^{-1} 6 \quad \mathrm{C}_{3} \mathrm{H}_{8}$

## Calculations CHECK-UP

| 11 | a 40,60 | b | 40,20 | c | $5.84,8.76$ |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 12 | 193.5 g | 13 | 9.39 g |  |  |  |  |
| 14 | a 1250 g | b | $96 \%$ | c | reversible, product lost on isolation, other reactions | d | $100 \%$ |
| 15 | a 529 g | b $94.5 \%$ | c | $52.9 \%$ | b |  |  |
| 17 | a $0.05,0.05,1.22 \times 10^{-3} \mathrm{~m}^{3}, 4.07 \mathrm{~g}$ |  | b $1.30 \mathrm{~g}, 2.77 \mathrm{~g}$ |  |  |  |  |

## TASK 16 - Solution calculations
